## ASTHMA AND ALLERGIC INFLAMMATION MODULATORS

This application claims the benefit under 35 U.S.C. § 119 of U.S. provisional application no. 60/435,366, filed December 20, 2002, the contents of which are hereby  
5 incorporated by reference in their entirety.

### BACKGROUND OF THE INVENTION

G-protein coupled receptors play important roles in diverse signaling processes, including those involved in host defense mechanisms. Immune responses to infectious diseases, injury, tumors and organ transplantation and in diseases and conditions such as asthma, allergy, rheumatoid arthritis and neoplasia have been linked to GPCR regulation. Exaggerated or misdirected immune responses are responsible for many inflammatory and hypersensitivity diseases which, left untreated, can result in tissue or organ damage, pain and/or loss of function. Tissue inflammation is largely implicated in the pathogenesis of such diseases, of which asthma and allergic diseases are among the most well characterized. The mechanisms underlying airway inflammation and hyperreactivity are similar to those underlying allergic inflammation in other tissues, such as the skin and gut.

Prostaglandins are lipid-derived inflammatory mediators that recruit macrophages, T cells, eosinophils, basophils and neutrophils from peripheral blood to damaged or inflamed tissues. In addition, prostaglandins can, depending on the target cell type, induce or inhibit intracellular  $\text{Ca}^{2+}$  mobilization, cAMP production, platelet aggregation, leukocyte aggregation, T cell proliferation, lymphocyte migration, and Th2 cell chemotaxis, IL-1 $\alpha$  and IL-2 secretion and vascular and non-vascular smooth muscle contraction in responsive cells. Prostaglandins have been implicated in fever, various allergic diseases, vascular and non-vascular smooth muscle relaxation, pain perception, sleep, platelet aggregation and reproductive processes. Prostaglandins exert their effects by interacting with specific GPCRs.

30 Prostaglandin D<sub>2</sub> (PGD<sub>2</sub>) is the major inflammatory mediator released by activated mast cells, typically found near skin surfaces, mucous membranes and blood vessels, upon immunological challenge (Lewis *et al.* (1982) *J. Immunol.*

129:1627-1631). During asthma and allergic responses, PGD<sub>2</sub> is released in large amounts. The role of PGD<sub>2</sub> in the initiation and maintenance of allergic inflammation has been well established in mouse models of asthma. For example, it has been demonstrated that overproduction of PGD<sub>2</sub> *in vivo* by PGD<sub>2</sub> synthase exacerbates 5 airway inflammation in a mouse model of asthma (Fujitani *et al.* (2002) *J. Immunol.* 168:443-449).

A PGD<sub>2</sub>-selective receptor, designated DP, has been identified (Boie *et al.* (1995) *J. Biol. Chem.* 270:18910-18916). In humans, DP is expressed in smooth muscle, platelets, small intestine and brain, and its expression in lung epithelium is 10 induced by allergic challenge. Receptor activation induces cAMP production and intracellular Ca<sup>2+</sup> mobilization, and is believed to inhibit platelet aggregation and cell migration and induce relaxation of various smooth muscles. DP is coupled primarily to Gαs protein.

Significantly, in an OVA induced asthma model, DP<sup>-/-</sup> mice exhibited 15 reduced asthma symptoms, e.g., reduced cellular infiltration of eosinophils and lymphocytes in BAL fluid, reduced Th2 cytokine levels in BAL fluid and reduced airway hyperreactivity to acetylcholine (Matsuoka *et al.* (2002) *Science* 287:2013-2019). The increased cellular infiltration in lung tissue and mucus secretion by airway epithelial cells characteristic of asthma in humans and observed in wild-type mice was 20 not observed in DP-deficient mice.

Recently, an additional PGD<sub>2</sub>-selective receptor, designated chemoattractant receptor-homologous molecule expressed on Th2 cells, or CRTH2, has been identified (Hirai *et al.* (2001) *J. Exp. Med.* 193(2):255-261). The receptor was previously referred to as GPR44 or DL1R. Among peripheral blood T lymphocytes, 25 human CRTH2 is selectively expressed on Th2 cells, and is highly expressed on cell types associated with allergic inflammation such as eosinophils, basophils and Th2 cells. It has been shown that CRTH2 activation induces intracellular Ca<sup>2+</sup> mobilization and infiltration of Th2 cells, eosinophils and basophils.

Protein sequence analysis indicates that CRTH2 has no significant 30 homology to DP, but rather, is related to members of the N-formyl peptide receptor (FPR) subfamily (Nagata *et al.* (1999) *J. Immunol.* 162:1278-1286). In contrast to DP, CRTH2 has been shown to couple primarily to Gαi protein.

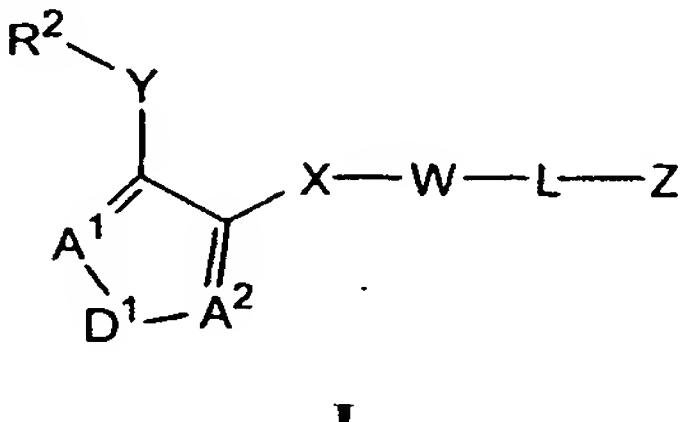

These observations suggest that CRTH2 and DP may function independently to regulate aspects of allergic inflammation.

The increasing incidence of asthma, allergic diseases and immunologic diseases worldwide underscores the need for new therapies to effectively treat or prevent these diseases. The discovery of small molecules that modulate CRTH2 and/or one or more other PGD<sub>2</sub> receptors, e.g., DP, is useful for the study of physiological processes mediated by CRTH2 and/or one or more other PGD<sub>2</sub> receptors, e.g., DP, and the development of therapeutic agents for asthma, allergic diseases and other immunologic diseases. Novel compounds which display such desirable activity are described herein.

In a preferred 30 embodiment, the modulation is direct. Inhibitors or antagonists are compounds that, *e.g.*, bind to, partially or totally block stimulation, decrease, prevent, inhibit, delay activation, inactivate, desensitize, or downregulate signal transduction. Activators or

5 *e.g.*, a transient transfection assay.

The term “CRTH2-modulating amount” refers to that amount of a compound that is needed to produce a desired effect in any one of the cell-based assays, biochemical assays or animal models described herein or otherwise known to the skilled artisan. Typically, a CRTH2-modulating amount of a compound will be at least  
10 that amount which exhibits an EC<sub>50</sub> in a reporter-gene cell-based assay (relative to an untreated control).

As used herein, the terms “CRTH2-responsive condition or disorder,” “condition or disorder responsive to CRTH2” and related terms and phrases refer to a condition or disorder associated with inappropriate, *e.g.*, less than or greater than  
15 normal, CRTH2 activity and at least partially responsive to or affected by CRTH2 modulation (*e.g.*, a CRTH2 antagonist or agonist results in some improvement in patient well-being in at least some patients). Inappropriate CRTH2 functional activity might arise as the result of CRTH2 expression in cells which normally do not express CRTH2, increased CRTH2 expression or degree of intracellular activation (leading to,  
20 *e.g.*, inflammatory and immune-related disorders and diseases) or decreased CRTH2 expression. A CRTH2-associated condition or disorder may include a CRTH2-mediated condition or disorder.

As used herein, the phrases “CRTH2-mediated condition or disorder,” “a condition or disorder mediated by CRTH2” and related phrases and terms refer to a condition or disorder characterized by inappropriate, *e.g.*, less than or greater than  
25 normal, CRTH2 activity. Inappropriate CRTH2 functional activity might arise as the result of CRTH2 expression in cells which normally do not express CRTH2, increased CRTH2 expression or degree of intracellular activation (leading to, *e.g.*, inflammatory and immune-related disorders and diseases) or decreased CRTH2 expression. A CRTH2-mediated condition or disorder may be completely or partially mediated by  
30 inappropriate CRTH2 functional activity. However, a CRTH2-mediated condition or disorder is one in which modulation of CRTH2 results in some effect on the underlying

condition or disorder (*e.g.*, an CRTH2 antagonist or agonist results in some improvement in patient well-being in at least some patients).

The term “PGD<sub>2</sub> receptor-modulating amount” and related terms and phrases refer to that amount of a compound that is needed to produce a desired effect in 5 any one of the cell-based assays, biochemical assays or animal models described herein or otherwise known to the skilled artisan. Typically, a PGD<sub>2</sub> receptor-modulating amount of a compound will be at least that amount which exhibits an EC<sub>50</sub> in a reporter-gene cell-based assay (relative to an untreated control).

Inappropriate functional 15 activity of another PGD<sub>2</sub> receptor might arise as the result of expression of another PGD<sub>2</sub> receptor in cells which normally do not express the receptor, increased expression of another PGD<sub>2</sub> receptor or degree of intracellular activation (leading to, *e.g.*, inflammatory and immune-related disorders and diseases) or decreased expression of another PGD<sub>2</sub> receptor. A condition or disorder associated with another PGD<sub>2</sub> 20 receptor may include a condition or disorder mediated by another PGD<sub>2</sub> receptor.

As used herein, the phrase “condition or disorder mediated by another PGD<sub>2</sub> receptor” and related phrases and terms refer to a condition or disorder characterized by inappropriate, *e.g.*, less than or greater than normal, activity of another PGD<sub>2</sub> receptor. Inappropriate functional activity of another PGD<sub>2</sub> receptor might arise 25 as the result of expression of another PGD<sub>2</sub> receptor in cells which normally do not express the receptor, increased expression of another PGD<sub>2</sub> receptor or degree of intracellular activation (leading to, *e.g.*, inflammatory and immune-related disorders and diseases) or decreased expression of another PGD<sub>2</sub> receptor. A condition or disorder mediated by another PGD<sub>2</sub> receptor may be completely or partially mediated 30 by inappropriate functional activity of another PGD<sub>2</sub> receptor. However, a condition or disorder mediated by of another PGD<sub>2</sub> receptor is one in which modulation of another PGD<sub>2</sub> receptor results in some effect on the underlying condition or disorder (*e.g.*,

another PGD<sub>2</sub> receptor antagonist or agonist results in some improvement in patient well-being in at least some patients).

The term "DP-modulating amount" refers to that amount of a compound that is needed to produce a desired effect in any one of the cell-based assays, biochemical assays or animal models described herein or otherwise known to the skilled artisan. Typically, a DP-modulating amount of a compound will be at least that amount which exhibits an EC<sub>50</sub> in a reporter-gene cell-based assay (relative to an untreated control).

As used herein, the terms "DP-responsive condition or disorder," "condition or disorder responsive to DP" and related terms and phrases refer to a condition or disorder associated with inappropriate, *e.g.*, less than or greater than normal, DP activity and at least partially responsive to or affected by DP modulation (*e.g.*, a DP antagonist or agonist results in some improvement in patient well-being in at least some patients). Inappropriate DP functional activity might arise as the result of DP expression in cells which normally do not express DP, increased DP expression or degree of intracellular activation (leading to, *e.g.*, inflammatory and immune-related disorders and diseases) or decreased DP expression. A DP-associated condition or disorder may include a DP-mediated condition or disorder.

As used herein, the phrases "DP-mediated condition or disorder," "a condition or disorder mediated by DP" and related phrases and terms refer to a condition or disorder characterized by inappropriate, *e.g.*, less than or greater than normal, DP activity. Inappropriate DP functional activity might arise as the result of DP expression in cells which normally do not express DP, increased DP expression or degree of intracellular activation (leading to, *e.g.*, inflammatory and immune-related disorders and diseases) or decreased DP expression. A DP-mediated condition or disorder may be completely or partially mediated by inappropriate DP functional activity. However, a DP-mediated condition or disorder is one in which modulation of DP results in some effect on the underlying condition or disorder (*e.g.*, an DP antagonist or agonist results in some improvement in patient well-being in at least some patients).

The term "alkyl," by itself or as part of another substituent, means, unless otherwise stated, a straight or branched chain, or cyclic hydrocarbon radical, or

combination thereof, which is fully saturated, having the number of carbon atoms designated (*i.e.*, C<sub>1</sub>-C<sub>8</sub> means one to eight carbons). Examples of alkyl groups include methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl, isobutyl, sec-butyl, cyclohexyl, (cyclohexyl)methyl, cyclopropylmethyl, homologs and isomers of, for example, n-pentyl, n-hexyl, n-heptyl, n-octyl and the like.

The term "alkenyl", by itself or as part of another substituent, means a straight or branched chain, or cyclic hydrocarbon radical, or combination thereof, which may be mono- or polyunsaturated, having the number of carbon atoms designated (*i.e.*, C<sub>2</sub>-C<sub>8</sub> means two to eight carbons) and one or more double bonds.

Examples of alkenyl groups include vinyl, 2-propenyl, crotyl, 2-isopentenyl, 2-(butadienyl), 2,4-pentadienyl, 3-(1,4-pentadienyl) and higher homologs and isomers thereof.

The term "alkynyl", by itself or as part of another substituent, means a straight or branched chain hydrocarbon radical, or combination thereof, which may be mono- or polyunsaturated, having the number of carbon atoms designated (*i.e.*, C<sub>2</sub>-C<sub>8</sub> means two to eight carbons) and one or more triple bonds. Examples of alkynyl groups include ethynyl, 1- and 3-propynyl, 3-butynyl and higher homologs and isomers thereof.

The term "alkylene" by itself or as part of another substituent means a 20 divalent radical derived from alkyl, as exemplified by -CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>- . Typically, an alkyl (or alkylene) group will have from 1 to 24 carbon atoms, with those groups having 10 or fewer carbon atoms being preferred in the present invention. A "lower alkyl" or "lower alkylene" is a shorter chain alkyl or alkylene group, generally having eight or fewer carbon atoms.

25 The terms "alkoxy," "alkylamino" and "alkylthio" (or thioalkoxy) are used in their conventional sense, and refer to those alkyl groups attached to the remainder of the molecule *via* an oxygen atom, an amino group, or a sulfur atom, respectively. Similarly, the term dialkylamino refers to an amino group having two attached alkyl groups that can be the same or different.

30 The term "heteroalkyl," by itself or in combination with another term, means, unless otherwise stated, a stable straight or branched chain, or cyclic hydrocarbon radical, or combinations thereof, consisting of the stated number of carbon

- atoms and from one to three heteroatoms selected from O, N, Si and S, and wherein the nitrogen and sulfur atoms may optionally be oxidized and the nitrogen heteroatom may optionally be quaternized. The heteroatom(s) O, N and S may be placed at any interior position of the heteroalkyl group. The heteroatom Si may be placed at any position of the heteroalkyl group, including the position at which the alkyl group is attached to the remainder of the molecule. Examples include -CH<sub>2</sub>-CH<sub>2</sub>-O-CH<sub>3</sub>, -CH<sub>2</sub>-CH<sub>2</sub>-NH-CH<sub>3</sub>, -CH<sub>2</sub>-CH<sub>2</sub>-N(CH<sub>3</sub>)-CH<sub>3</sub>, -CH<sub>2</sub>-S-CH<sub>2</sub>-CH<sub>3</sub>, -CH<sub>2</sub>-CH<sub>2</sub>-S(O)-CH<sub>3</sub>, -CH<sub>2</sub>-CH<sub>2</sub>-S(O)<sub>2</sub>-CH<sub>3</sub>, -CH=CH-O-CH<sub>3</sub>, -Si(CH<sub>3</sub>)<sub>3</sub>, -CH<sub>2</sub>-CH=N-OCH<sub>3</sub>, and -CH=CH-N(CH<sub>3</sub>)-CH<sub>3</sub>. Up to two heteroatoms may be consecutive, such as, for example, -CH<sub>2</sub>-NH-OCH<sub>3</sub> and -CH<sub>2</sub>-O-Si(CH<sub>3</sub>)<sub>3</sub>. When a prefix such as (C<sub>2</sub>-C<sub>8</sub>) is used to refer to a heteroalkyl group, the number of carbons (2-8, in this example) is meant to include the heteroatoms as well. For example, a C<sub>2</sub>-heteroalkyl group is meant to include, for example, -CH<sub>2</sub>OH (one carbon atom and one heteroatom replacing a carbon atom) and -CH<sub>2</sub>SH. The term "heteroalkylene" by itself or as part of another substituent means a divalent radical derived from heteroalkyl, as exemplified by -CH<sub>2</sub>-CH<sub>2</sub>-S-CH<sub>2</sub>CH<sub>2</sub>- and -CH<sub>2</sub>-S-CH<sub>2</sub>-CH<sub>2</sub>-NH-CH<sub>2</sub>-.
- For heteroalkylene groups, heteroatoms can also occupy either or both of the chain termini (*e.g.*, alkyleneoxy, alkylenedioxy, alkyleneamino, alkylenediamino, and the like). Still further, for alkylene and heteroalkylene linking groups, no orientation of the linking group is implied.
- The terms "cycloalkyl" and "heterocycloalkyl", by themselves or in combination with other terms, represent, unless otherwise stated, cyclic versions of "alkyl" and "heteroalkyl", respectively. Thus, the terms "cycloalkyl" and "heterocycloalkyl" are meant to be included in the terms "alkyl" and "heteroalkyl", respectively. Additionally, for heterocycloalkyl, a heteroatom can occupy the position at which the heterocycle is attached to the remainder of the molecule. Examples of cycloalkyl include cyclopentyl, cyclohexyl, 1-cyclohexenyl, 3-cyclohexenyl, cycloheptyl, and the like. Examples of heterocycloalkyl include 1-(1,2,5,6-tetrahydropyridyl), 1-piperidinyl, 2-piperidinyl, 3-piperidinyl, 4-morpholinyl, 3-morpholinyl, tetrahydrofuran-2-yl, tetrahydrofuran-3-yl, tetrahydrothien-2-yl, tetrahydrothien-3-yl, 1-piperazinyl, 2-piperazinyl, and the like.

The terms "halo" or "halogen," by themselves or as part of another substituent, mean, unless otherwise stated, a fluorine, chlorine, bromine, or iodine

atom. Additionally, terms such as "haloalkyl", are meant to include alkyl substituted with halogen atoms which can be the same or different, in a number ranging from one to  $(2m'+1)$ , where  $m'$  is the total number of carbon atoms in the alkyl group. For example, the term "halo(C<sub>1</sub>-C<sub>4</sub>)alkyl" is meant to include trifluoromethyl, 2,2,2-5 trifluoroethyl, 4-chlorobutyl, 3-bromopropyl, and the like. Thus, the term "haloalkyl" includes monohaloalkyl (alkyl substituted with one halogen atom) and polyhaloalkyl (alkyl substituted with halogen atoms in a number ranging from two to  $(2m'+1)$  halogen atoms). The term "perhaloalkyl" means, unless otherwise stated, alkyl substituted with  $(2m'+1)$  halogen atoms, where  $m'$  is the total number of carbon atoms 10 in the alkyl group. For example, the term "perhalo(C<sub>1</sub>-C<sub>4</sub>)alkyl", is meant to include trifluoromethyl, pentachloroethyl, 1,1,1-trifluoro-2-bromo-2-chloroethyl, and the like.

The term "aryl" means, unless otherwise stated, a polyunsaturated, typically aromatic, hydrocarbon substituent which can be a single ring or multiple rings (up to three rings) which are fused together or linked covalently. The term "heteroaryl" 15 refers to aryl groups (or rings) that contain from one to four heteroatoms selected from the group consisting of N, O and S, wherein the nitrogen and sulfur atoms are optionally oxidized, and the nitrogen atom(s) are optionally quaternized. A heteroaryl group can be attached to the remainder of the molecule through a heteroatom. Non-limiting examples of aryl and heteroaryl groups include phenyl, 1-naphthyl, 2-naphthyl, 20 4-biphenyl, 1-pyrrolyl, 2-pyrrolyl, 3-pyrrolyl, 3-pyrazolyl, 2-imidazolyl, 4-imidazolyl, pyrazinyl, 2-oxazolyl, 4-oxazolyl, 2-phenyl-4-oxazolyl, 5-oxazolyl, 3-isoxazolyl, 4-isoxazolyl, 5-isoxazolyl, 2-thiazolyl, 4-thiazolyl, 5-thiazolyl, 2-furyl, 3-furyl, 2-thienyl, 3-thienyl, 2-pyridyl, 3-pyridyl, 4-pyridyl, 2-pyrimidyl, 4-pyrimidyl, 2-pyrimidinyl, 4-pyrimidinyl, 5-pyrimidinyl, 3-pyridazinyl, 4-pyridazinyl, 5-benzothiazolyl, purinyl, 25 2-benzimidazolyl, 5-indolyl, 1H-indazole, carbazole,  $\alpha$ -carboline,  $\beta$ -carboline,  $\gamma$ -carboline, 1-isoquinolyl, 5-isoquinolyl, 2-quinoxalinyl, 5-quinoxalinyl, 2-quinolyl, 3-quinolyl, 4-quinolyl, 5-quinolyl, 6-quinolyl, 7-quinolyl and 8-quinolyl.

Preferably, the term "aryl" refers to a phenyl or naphthyl group which is unsubstituted or substituted. Preferably, the term "heteroaryl" refers to a pyrrolyl, 30 pyrazolyl, imidazolyl, pyrazinyl, oxazolyl, isoxazolyl, thiazolyl, furyl, thienyl, pyridyl, pyrimidyl, benzothiazolyl, purinyl, benzimidazolyl, indolyl, isoquinolyl, quinoxalinyl or quinolyl group which is unsubstituted or substituted.

For brevity, the term "aryl" when used in combination with other terms (e.g., aryloxy, arylthioxy, arylalkyl) includes both aryl and heteroaryl rings as defined above. Thus, the term "arylalkyl" is meant to include those radicals in which an aryl group is attached to an alkyl group (e.g., benzyl, phenethyl, pyridylmethyl and the like) including those alkyl groups in which a carbon atom (e.g., a methylene group) has been replaced by, for example, an oxygen atom (e.g., phenoxyethyl, 2-pyridyloxymethyl, 3-(1-naphthoxy)propyl, and the like).

Each of the above terms (e.g., "alkyl," "heteroalkyl," "aryl" and "heteroaryl") is meant to include both substituted and unsubstituted forms of the indicated radical, unless otherwise indicated. Preferred substituents for each type of radical are provided below.

Substituents for the alkyl and heteroalkyl radicals (as well as those groups referred to as alkylene, alkenyl, heteroalkylene, heteroalkenyl, alkynyl, cycloalkyl, heterocycloalkyl, cycloalkenyl and heterocycloalkenyl) can be a variety of groups selected from: -OR', =O, =NR', =N-OR', -NR'R'', -SR', halogen, -SiR'R''R'', -OC(O)R', -C(O)R', -CO<sub>2</sub>R', -CONR'R'', -OC(O)NR'R'', -NR''C(O)R', -NR'-C(O)NR''R''', -NR'-SO<sub>2</sub>NR''R''', -NR''CO<sub>2</sub>R', -NH-C(NH<sub>2</sub>)=NH, -NR'C(NH<sub>2</sub>)=NH, -NH-C(NH<sub>2</sub>)=NR', -S(O)R', -SO<sub>2</sub>R', -SO<sub>2</sub>NR'R'', -NR''SO<sub>2</sub>R, -CN and -NO<sub>2</sub>, in a number ranging from zero to three, with those groups having zero, one or two substituents being particularly preferred. R', R'' and R''' each independently refer to hydrogen, unsubstituted (C<sub>1</sub>-C<sub>8</sub>)alkyl and heteroalkyl, unsubstituted aryl, aryl substituted with one to three halogens, unsubstituted alkyl, alkoxy or thioalkoxy groups, or aryl-(C<sub>1</sub>-C<sub>4</sub>)alkyl groups. When R' and R'' are attached to the same nitrogen atom, they can be combined with the nitrogen atom to form a 5-, 6- or 7-membered ring. For example, -NR'R'' is meant to include 1-pyrrolidinyl and 4-morpholinyl. Typically, an alkyl or heteroalkyl group will have from zero to three substituents, with those groups having two or fewer substituents being preferred in the present invention. More preferably, an alkyl or heteroalkyl radical will be unsubstituted or monosubstituted. Most preferably, an alkyl or heteroalkyl radical will be unsubstituted. From the above discussion of substituents, one of skill in the art will understand that the term "alkyl" is meant to include groups such as trihaloalkyl (e.g., -CF<sub>3</sub> and -CH<sub>2</sub>CF<sub>3</sub>).

Preferred substituents for the alkyl and heteroalkyl radicals are selected from: -OR', =O, -NR'R'', -SR', halogen, -SiR'R''R''', -OC(O)R', -C(O)R', -CO<sub>2</sub>R', -CONR'R'', -OC(O)NR'R'', -NR''C(O)R', -NR''CO<sub>2</sub>R', -NR'-SO<sub>2</sub>NR''R''', -S(O)R', -SO<sub>2</sub>R', -SO<sub>2</sub>NR'R'', -NR''SO<sub>2</sub>R, -CN and -NO<sub>2</sub>, where R' and R'' are as defined above.

- 5 Further preferred substituents are selected from: -OR', =O, -NR'R'', halogen, -OC(O)R', -CO<sub>2</sub>R', -CONR'R'', -OC(O)NR'R'', -NR''C(O)R', -NR''CO<sub>2</sub>R', -NR'-SO<sub>2</sub>NR''R''', -SO<sub>2</sub>R', -SO<sub>2</sub>NR'R'', -NR''SO<sub>2</sub>R, -CN and -NO<sub>2</sub>.

Similarly, substituents for the aryl and heteroaryl groups are varied and are selected from: -halogen, -OR', -OC(O)R', -NR'R'', -SR', -R', -CN, -NO<sub>2</sub>, -CO<sub>2</sub>R', -CONR'R'', -C(O)R', -OC(O)NR'R'', -NR''C(O)R', -NR''C(O)<sub>2</sub>R', -NR'-C(O)NR''R''', -NH-C(NH<sub>2</sub>)=NH, -NR'C(NH<sub>2</sub>)=NH, -NH-C(NH<sub>2</sub>)=NR', -S(O)R', -S(O)<sub>2</sub>R', -S(O)<sub>2</sub>NR'R'', -N<sub>3</sub>, -CH(Ph)<sub>2</sub>, perfluoro(C<sub>1</sub>-C<sub>4</sub>)alkoxy, and perfluoro(C<sub>1</sub>-C<sub>4</sub>)alkyl, in a number ranging from zero to the total number of open valences on the aromatic ring system; and where R', R'' and R''' are independently selected from hydrogen,

10 (C<sub>1</sub>-C<sub>8</sub>)alkyl and heteroalkyl, unsubstituted aryl and heteroaryl, (unsubstituted aryl)-(C<sub>1</sub>-C<sub>4</sub>)alkyl, and (unsubstituted aryl)oxy-(C<sub>1</sub>-C<sub>4</sub>)alkyl.

15

Two of the substituents on adjacent atoms of the aryl or heteroaryl ring may optionally be replaced with a substituent of the formula -T-C(O)-(CH<sub>2</sub>)<sub>q</sub>-U-, wherein T and U are independently -NH-, -O-, -CH<sub>2</sub>- or a single bond, and q is an integer of from 0 to 2. Alternatively, two of the substituents on adjacent atoms of the aryl or heteroaryl ring may optionally be replaced with a substituent of the formula -A-(CH<sub>2</sub>)<sub>r</sub>-B-, wherein A and B are independently -CH<sub>2</sub>-, -O-, -NH-, -S-, -S(O)-, -S(O)<sub>2</sub>-, -S(O)<sub>2</sub>NR'- or a single bond, and r is an integer of from 1 to 3. One of the single bonds of the new ring so formed may optionally be replaced with a double bond.

20

25 Alternatively, two of the substituents on adjacent atoms of the aryl or heteroaryl ring may optionally be replaced with a substituent of the formula -(CH<sub>2</sub>)<sub>s</sub>-X-(CH<sub>2</sub>)<sub>t</sub>-, where s and t are independently integers of from 0 to 3, and X is -O-, -NR'-, -S-, -S(O)-, -S(O)<sub>2</sub>-, or -S(O)<sub>2</sub>NR'. The substituent R' in -NR'- and -S(O)<sub>2</sub>NR'- is selected from hydrogen or unsubstituted (C<sub>1</sub>-C<sub>6</sub>)alkyl. Otherwise, R' is as defined above.

30

As used herein, the term "heteroatom" is meant to include oxygen (O), nitrogen (N), sulfur (S) and silicon (Si).

The term "pharmaceutically acceptable salts" is meant to include salts of

the active compounds which are prepared with relatively nontoxic acids or bases, depending on the particular substituents found on the compounds described herein. When compounds of the invention contain relatively acidic functionalities, base addition salts can be obtained by contacting the neutral form of such compounds with a sufficient amount of the desired base, either neat or in a suitable inert solvent.

5 Examples of pharmaceutically acceptable base addition salts include sodium, potassium, calcium, ammonium, organic amino, or magnesium salt, or a similar salt.

When compounds of the invention contain relatively basic functionalities, acid addition salts can be obtained by contacting the neutral form of such compounds with a sufficient amount of the desired acid, either neat or in a suitable inert solvent.

10 Examples of pharmaceutically acceptable acid addition salts include those derived from inorganic acids like hydrochloric, hydrobromic, nitric, carbonic, monohydrogencarbonic, phosphoric, monohydrogenphosphoric, dihydrogenphosphoric, sulfuric, monohydrogensulfuric, hydriodic, or phosphorous acids and the like, as well as the salts derived from relatively nontoxic organic acids like acetic, propionic, isobutyric, maleic, malonic, benzoic, succinic, suberic, fumaric, mandelic, phthalic, benzenesulfonic, p-tolylsulfonic, citric, tartaric, methanesulfonic, and the like. Also included are salts of amino acids such as arginate and the like, and salts of organic acids like glucuronic or galacturonic acids and the like (see, for example, Berge *et al.*

15 (1977) *J. Pharm. Sci.* **66**:1-19). Certain specific compounds of the invention contain both basic and acidic functionalities that allow the compounds to be converted into either base or acid addition salts.

The neutral forms of the compounds may be regenerated by contacting the salt with a base or acid and isolating the parent compound in the conventional manner. The parent form of the compound differs from the various salt forms in certain physical properties, such as solubility in polar solvents, but otherwise the salts are equivalent to the parent form of the compound for the purposes of the invention.

20 In addition to salt forms, the invention provides compounds which are in a prodrug form. Prodrugs of the compounds described herein are those compounds that readily undergo chemical changes under physiological conditions to provide the compounds of the invention. Additionally, prodrugs can be converted to the compounds of the invention by chemical or biochemical methods in an *ex vivo*

environment. For example, prodrugs can be slowly converted to the compounds of the invention when placed in a transdermal patch reservoir with a suitable enzyme or chemical reagent. Prodrugs are often useful because, in some situations, they may be easier to administer than the parent drug. They may, for instance, be bioavailable by oral administration whereas the parent drug is not. The prodrug may also have improved solubility in pharmaceutical compositions over the parent drug. A wide variety of prodrug derivatives are known in the art, such as those that rely on hydrolytic cleavage or oxidative activation of the prodrug. An example, without limitation, of a prodrug would be a compound of the invention which is administered as an ester (the "prodrug"), but then is metabolically hydrolyzed to the carboxylic acid, the active entity. Additional examples include peptidyl derivatives of a compound of the invention.

Certain compounds of the invention can exist in unsolvated forms as well as solvated forms, including hydrated forms. In general, the solvated forms are equivalent to unsolvated forms and are intended to be encompassed within the scope of the invention. Certain compounds of the invention may exist in multiple crystalline or amorphous forms. In general, all physical forms are equivalent for the uses contemplated by the invention and are intended to be within the scope of the invention.

Certain compounds of the invention possess asymmetric carbon atoms (optical centers) or double bonds; the racemates, enantiomers, diastereomers, geometric isomers and individual isomers are all intended to be encompassed within the scope of the invention. These isomers can be resolved or asymmetrically synthesized using conventional methods to render the isomers "optically pure", *i.e.*, substantially free of its other isomers. If, for instance, a particular enantiomer of a compound of the present invention is desired, it may be prepared by asymmetric synthesis, or by derivation with a chiral auxilliary, where the resulting diastereomeric mixture is separated and the auxilliary group cleaved to provide the pure desired enantiomers. Alternatively, where the molecule contains a basic functional group, such as amino, or an acidic functional group, such as carboxyl, diastereomeric salts are formed with an appropriate optically-active acid or base, followed by resolution of the diasteromers thus formed by fractional crystallization or chromatographic means well known in the art, and subsequent recovery of the pure enantiomers.

The compounds of the invention may also contain unnatural proportions of atomic isotopes at one or more of the atoms that constitute such compounds. For example, the compounds may be radiolabeled with radioactive isotopes, such as for example tritium (<sup>3</sup>H), iodine-125 (<sup>125</sup>I) or carbon-14 (<sup>14</sup>C). Radiolabeled compounds are 5 useful as therapeutic or prophylactic agents, *e.g.*, cancer therapeutic agents, research reagents, *e.g.*, CRTH2 assay reagents, and diagnostic agents, *e.g.*, *in vivo* imaging agents. All isotopic variations of the compounds of the invention, whether radioactive or not, are intended to be encompassed within the scope of the invention.

## 10 Embodiments of the Invention

A class of compounds that modulate CRTH2 and/or DP and/or one or more other PGD<sub>2</sub> receptors has been discovered. Depending on the biological environment (*e.g.*, cell type, pathological condition of the host, *etc.*), these compounds 15 can activate or inhibit the actions of CRTH2 and/or one or more other PGD<sub>2</sub> receptors (*e.g.*, ligand binding). By activating or inhibiting CRTH2 and/or one or more other PGD<sub>2</sub> receptors, the compounds will find use as therapeutic agents capable of modulating diseases and conditions responsive to modulation of CRTH2 and/or one or more other PGD<sub>2</sub> receptors and/or mediated by CRTH2 and/or one or more other PGD<sub>2</sub> 20 receptors. As noted above, examples of such diseases and conditions include inflammatory conditions, immune disorders, asthma, allergic rhinitis, eczema, psoriasis, atopic dermatitis, fever, sepsis, systemic lupus erythematosus, diabetes, rheumatoid arthritis, multiple sclerosis, atherosclerosis, transplant rejection, inflammatory bowel disease, cancer, viral infection, thrombosis, fibrosis, flushing, Crohn's disease, 25 ulcerative colitis, chronic obstructive pulmonary disease, inflammation, pain, conjunctivitis, nasal congestion and urticaria. Additionally, the compounds are useful for the treatment and/or prevention of complications of these diseases and disorders (*e.g.*, cardiovascular disease).

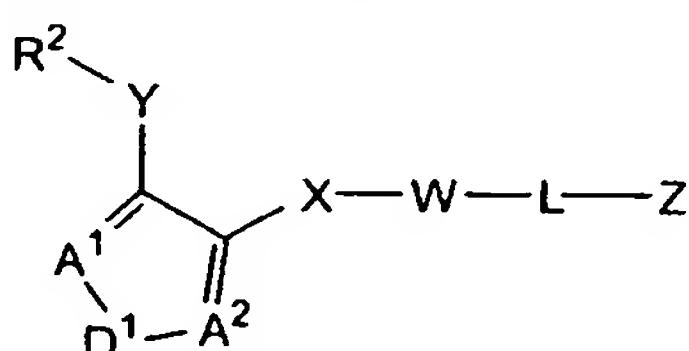

While the compounds of the invention are believed to exert their effects 30 by interacting with CRTH2, the mechanism of action by which the compounds act is not a limiting embodiment of the invention. For example, compounds of the invention may interact with PGD<sub>2</sub> receptor subtypes other than CRTH2, *e.g.*, DP receptor, and/or

other prostanoid receptors, *e.g.*, thromboxane A<sub>2</sub> (TXA<sub>2</sub>) receptor. Indeed, as alluded to above, the present invention specifically contemplates the use of the disclosed compounds to modulate one or more PGD<sub>2</sub> receptors other than CRTH2.

Compounds contemplated by the invention include, but are not limited  
5 to, the exemplary compounds provided herein.

All methods include the step of bringing the active ingredient into association with the carrier which constitutes one or more accessory ingredients. In general, the pharmaceutical compositions are prepared by uniformly and intimately bringing the active ingredient into association 25 with a liquid carrier or a finely divided solid carrier or both, and then, if necessary, shaping the product into the desired formulation. In the pharmaceutical composition the active object compound is included in an amount sufficient to produce the desired effect upon the process or condition of diseases.

The pharmaceutical compositions containing the active ingredient may 30 be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any

method known to the art for the manufacture of pharmaceutical compositions. Such compositions may contain one or more agents selected from sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active 5 ingredient in admixture with other non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and 10 lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the techniques 15 described in U.S. Patent Nos. 4,256,108; 4,166,452 and 4,265,874 to form osmotic therapeutic tablets for control release.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active 20 ingredient is mixed with water or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, 25 hydroxy-propylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxy-ethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol 30 monooleate, or condensation products of ethylene oxide with partial esters derived from

fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose or saccharin.

5           Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide a palatable oral  
10 preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

15           Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavoring and coloring agents, may also be present.

20           The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring gums, for example gum acacia or gum tragacanth, naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene  
25 oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavoring agents.

Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavoring and coloring agents.

30           The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleagenous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and

suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, for example as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's 5 solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

The pharmaceutical compositions may also be administered in the form 10 of suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

For topical use, creams, ointments, jellies, solutions or suspensions, *etc.*, 15 containing the compounds of the invention are employed. As used herein, topical application is also meant to include the use of mouthwashes and gargles.

The pharmaceutical compositions and methods of the invention may further comprise other therapeutically active compounds, as noted herein, useful in the treatment of asthma, allergic diseases, inflammatory conditions and cancer and 20 pathologies associated therewith (*e.g.*, cardiovascular disease) or other adjuvant. In many instances, compositions which include a compounds of the invention and an alternative agent have additive or synergistic effects when administered.

### 30     *Analysis of the Compounds*

In yet another aspect, the invention includes methods to evaluate

putative specific agonists or antagonists of CRTH2 and/or one or more other PGD<sub>2</sub> receptors. Accordingly, the invention is directed to the use of these compounds in the preparation and execution of screening assays for compounds which modulate the function of CRTH2 and/or one or more other PGD<sub>2</sub> receptors. For example, the  
5 compounds of this invention are useful for CRTH2 mutants and/or one or more other PGD<sub>2</sub> receptor mutants, which are excellent screening tools for potent compounds. Furthermore, the compounds of this invention are useful in establishing or determining the binding site of other compounds to CRTH2 and/or one or more other PGD<sub>2</sub> receptors, *e.g.*, by competitive inhibition. The compounds of the instant invention are  
10 also useful for the evaluation of putative specific modulators of CRTH2 and/or one or more other PGD<sub>2</sub> receptors. One of skill in the art will appreciate that thorough evaluation of specific agonists and antagonists of PGD<sub>2</sub> receptors has been hampered by the lack of availability of non-peptidyl (metabolically resistant) compounds with high binding affinity for these receptors. The compounds provided herein are  
15 particularly useful in this context.

#### *High Throughput Screening*

High throughput assays for the presence, absence, quantification, or  
20 other properties of particular compounds may be used to test a combinatorial library that contains a large number of potential therapeutic compounds (potential modulator compounds). The assays are typically designed to screen large chemical libraries by automating the assay steps and providing compounds from any convenient source to the assays, which are typically run in parallel (*e.g.*, in microtiter formats on microtiter  
25 plates in robotic assays). Preferred assays detect enhancement or inhibition of CRTH2 and/or one or more other PGD<sub>2</sub> receptors function.

High throughput screening systems are commercially available (*see e.g.*, Zymark Corp., Hopkinton MA; Air Technical Industries, Mentor OH; Beckman Instruments, Inc., Fullerton CA; Precision Systems, Inc., Natick MA; *etc.*). These  
30 systems typically automate entire procedures, including all sample and reagent pipetting, liquid dispensing, timed incubations, and final readings of the microplate in detector(s) appropriate for the assay. These configurable systems provide high

throughput and rapid start-up as well as a high degree of flexibility and customization. The manufacturers of such systems provide detailed protocols for various high throughput systems. Thus, for example, Zymark Corp. provides technical bulletins describing screening systems for detecting the modulation of gene transcription, ligand binding, and the like.

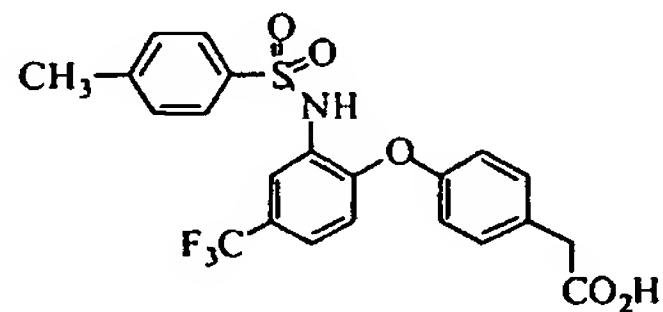

The following examples are offered by way of illustration and are not intended to limit the scope of the invention. Those of skill in the art will readily recognize a variety of noncritical parameters that could be modified to yield essentially similar results.

## EXAMPLES

Reagents and solvents used below can be obtained from commercial sources such as Aldrich Chemical Co. (Milwaukee, Wisconsin, USA). <sup>1</sup>H-NMR spectra were recorded on a Varian Gemini 400 MHz NMR spectrometer. Significant peaks are tabulated in the order: multiplicity (s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br s, broad singlet), coupling constant(s) in Hertz (Hz) and number of protons. Electron Ionization (EI) mass spectra were recorded on a Hewlett Packard 5989A mass spectrometer. Mass spectrometry results are reported as the ratio of mass over charge, followed by the relative abundance of each ion (in parentheses) or a single m/z value for the M+H (or, as noted, M-H) ion containing the most common atomic isotopes. Isotope patterns correspond to the expected formula in all cases.

Electrospray ionization (ESI) mass spectrometry analysis was conducted on a Hewlett-Packard 1100 MSD electrospray mass spectrometer using the HP1 100 HPLC for sample delivery. Normally the analyte was dissolved in methanol at 0.1 mg/mL and 1 microliter was infused with the delivery solvent into the mass spectrometer, which scanned from 100 to 1500 daltons. All compounds could be analyzed in the positive ESI mode, using 1:1 acetonitrile/water with 1% acetic acid as the delivery solvent. The compounds provided below could also be analyzed in the negative ESI mode, using 2mM NH<sub>4</sub>OAc in acetonitrile/water as delivery solvent.

#### *Human CRTH2 binding assay*

Full-length human CRTH2 cDNA was generated by polymerase chain reaction (PCR) using human genomic DNA as template and subsequently cloned into 20 pCDNA3.1(+) (*Invitrogen*), generating a CRTH2 expression plasmid pHLT124. The plasmid was transfected into 293 cells, which normally express CRTH2, using LipofectAMINETM reagents (*Gibco/BRL*). G418 (800mg/mL) was added to the culture 48 h after transfection and cells were maintained under selection for 3 weeks to ensure that all surviving cells stably expressed CRTH2. These cells are labeled as 25 293(124) hereafter.

$^3\text{H}$ -PGD<sub>2</sub> binding assay was performed using 293(124) cells. In brief, cells were washed and suspended in RPMI containing 0.5% BSA and 20mM HEPES. Each assay contained 25,000 cells, appropriate amount of test compound when necessary and a mixture of 1nM  $^3\text{H}$ -PGD<sub>2</sub> (*Amersham Pharmacia Biotech*) and 30nM 30 of unlabeled PGD<sub>2</sub> (*Cayman Chemicals*) in 200 mL final volume. The cell mixture was incubated at room temperature for 2.5 h with shaking and the cells were separated from free  $^3\text{H}$ -PGD<sub>2</sub> and transferred onto a filter plate using a cell harvester. Radioactivity

bound to the cells was measured on a liquid scintillation counter. Nonspecific binding was determined in the presence of 10mM of unlabeled PGD<sub>2</sub>.

Modulation of CRTH2 and/or one or more other PGD<sub>2</sub> receptors by test compounds can be assessed by other *in vitro* and *in vivo* assays. Examples of such assays include measuring second messenger (*e.g.*, cAMP, IP<sub>3</sub> or Ca<sup>2+</sup>) levels, ion flux, phosphorylation levels, transcription levels, and the like. Recombinant or naturally occurring CRTH2 polypeptides and/or other PGD<sub>2</sub> receptor peptides can be used and the protein can be isolated, expressed in a cell, expressed in a membrane derived from a cell, expressed in tissue or in an animal. Signal transduction can also be examined *in vitro* with soluble or solid state reactions, using a chimeric molecule such as an extracellular domain of a receptor covalently linked to a heterologous signal transduction domain, or a heterologous extracellular domain covalently linked to the transmembrane and/or cytoplasmic domain of a receptor. Gene amplification can also be examined. Furthermore, ligand-binding domains of the protein of interest can be used *in vitro* in soluble or solid state reactions to assay for ligand binding.

CRTH2-G-protein or another PGD<sub>2</sub> receptor-G-protein interactions can also be examined, by, for example, analysis of binding of the G-protein to the receptor or its release from the receptor.

Exemplary compounds of the invention displayed IC<sub>50</sub> values as shown in Table I in the above-described ligand binding assay.

#### *Cyclic AMP assays on human DP function*

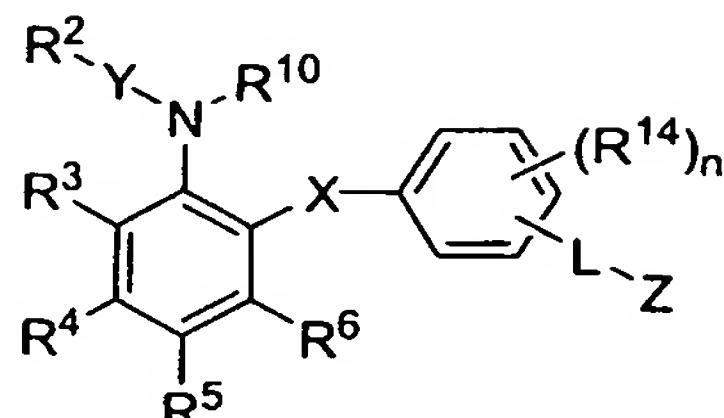

Cyclic AMP assays on human DP function are performed using human platelets (AllCells, Berkeley, CA) and the 96-well Tropix cAMP ELISA System  
15 (Applied Biosystems) following the manufacturer's manual. Briefly, the human platelets rich plasma (PRP) is diluted 1:3 with human plasma and incubated with 1mM of the phosphodiesterases inhibitor 3-isobutyl-1-methylxanthine (IBMX, Sigma) at 37 °C for 20 min, to prevent hydrolysis of cAMP. 20 µl of the above PRP sample is mixed 1:1:1 with the test compound and PGD<sub>2</sub> (both prepared in the assay buffer with

DMSO concentration <1%) in a 96-well plate. The assay buffer can be OPTI-free medium (Gibco BRL). After 20 min incubation at 37 °C, 20  $\mu$ l of lysis buffer from the kit is added to each well of the mixture and the plate then incubated at room temperature for 10 min with moderate shaking and at 37 °C for 10 min. After the cell 5 lysis, 60  $\mu$ l of the cell lysate together with 30  $\mu$ l of diluted cAMP-AP conjugate and 60  $\mu$ l anti-cAMP antibody is then transferred into a kit assay plate and the plate incubated at room temperature for 30 min with shaking. The plate is then washed with wash buffer and incubated with 100  $\mu$ l per well of substrate/enhancer solution at room temperature for 60 min. Light signal intensity, which is inversely proportional to the 10 cAMP level in each sample, is measured in a luminometer (CLIPR, Dynamic Devices). The final human plasma concentration in the assay described above is about 33%. The assays are also performed using washed platelets (prepared by centrifuging the PRP at 2000 rpm for 15 min and resuspending the platelets in the assay buffer), or in the presence of higher than about 33% of human plasma by also preparing the test 15 compound and/or PGD<sub>2</sub> solution in human plasma.

**INTERNATIONAL SEARCH REPORT**

International application No.

PCT/US03/40617

**Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)**

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claim Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
  
2.  Claim Nos.: 1-20 and 22-46  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:  
Please See Continuation Sheet
  
3.  Claim Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
  
4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**  

The additional search fees were accompanied by the applicant's protest.

 No protest accompanied the payment of additional search fees.

**INTERNATIONAL SEARCH REPORT****Continuation of Box I Reason 2:**

In these claims, the numerous variables (e.g. R1, R2, R3, R4-R14, L, X, Y, Z, etc), their voluminous complex meanings, their seemingly endless permutations and combinations make it virtually impossible to determine the full scope and complete meaning of the claimed subject matter. As presented, the claimed subject matter cannot be regarded as being a clear and concise description for which protection is sought and as such the listed claims do not comply with the requirements of PCT article 6. Thus it is impossible to carry out a meaningful search on same. A search will be made on the first discernable invention in claim 21.
